

Dependable innovation *with every move*

Stearns Roger, a Framatome business line, has been designing, fabricating and installing safe, reliable fuel handling equipment since the 1960s. That experience has led to more than 100 system implementations as well as speed and reliability upgrades — and we're still expanding around the world.

Today, we continue to develop innovative solutions that improve speed, add automation, modernize controls, and address obsolescence and reliability challenges.

Our team brings together decades of hands-on expertise with Framatome's broad engineering capabilities to design and build equipment for both existing nuclear plants and the next generation of advanced and small modular reactors.

Whether you're upgrading an operating facility or planning a new advanced reactor, Stearns Roger delivers dependable innovation with every move.

Count on it.
