Unlocking more power from the nuclear fleet

Power demand is surging, and optimizing existing nuclear assets is the fastest way to meet it with clean energy. The DOE's UPRISE initiative targets 5 GW of new nuclear capacity by 2029 through restarts, uprates, license renewals and modernization.

Framatome is already delivering on that vision: supplying all the fuel for three nuclear plant restarts, providing all necessary inspections and maintenance for reactor vessels and steam generators, more than 60,000 hours of restart engineering support, deep experience in U.S. power uprates and 65 years powering America's nuclear fleet across our 10 U.S. facilities.

When utilities need to revive, renew, upgrade or extend critical assets, Framatome is ready.

Count on it.
