What’s buried can stay buried.

Buried piping degradation is an industry-wide challenge. We have a long-lasting solution.

Our engineers developed a quick-curing, spray-in-place liner with a 50+ year design life and structural design basis and capacity.

Robotic equipment remotely, quickly and seamlessly applies the liner inside small-or large-bore pipes.

This application is site-specifically engineered and integrated with your system designs.

This alternative to full excavation eliminates confined space requirements and increases project safety margins. Twenty four hours after application, you’re back in service, and what’s buried can stay buried.

Count on it.
