

Supporting the next generation of generation

For more than 60 years, Framatome has been a leading provider of fuel, products and services to nuclear power plants.

We continue to advance technologies that improve plant performance, including collaborating with the Department of Energy on the design and fabrication of enhanced accident tolerant fuel, higher enriched fuel and the development of digital twin diagnostics that predict maintenance needs of plant systems.

To support the future of nuclear energy, Framatome is designing and producing components and equipment for SMRs and advanced reactors as well as developing HALEU fuels like TRIGA and TRISO with our DOE and industry partners.

Framatome is your trusted partner in innovation and sustainability — then, now and for the next generation of generation.

Count on it.
