

A new 24-month standard

What could you do with an extra six months? By adopting Framatome's Advanced Fuel Management (AFM) program technologies you can extend your fuel cycles and be without refueling interruptions for two years.

Sound good? Get ready. Beginning in 2027, Framatome is delivering fuel with higher uranium enrichments and burnup limits, extending your

operating cycles from 18 to 24 months, increasing your operational time and energy output.

We're committed to raising the standard for nuclear fuel — so you can improve plant economics and unlock your reactor's potential.

Count on it.
