health and the environment, including the Ottawa River, and that the proposed site is an acceptable and safe location for the facility.

The NSDF is expected to provide for the permanent disposal of up to 1 million cubic meters of solid LLW, such as contaminated personal protective clothing and building materials. Most of the waste to be placed in the NSDF is currently in storage at the Chalk River site or will be generated from environmental remediation, decommissioning, and operational activities at the site, which has been in operation for 80 years. According to the CNSC, approximately 10 percent of the waste volume will come from other Atomic Energy of Canada Limited sites or from commercial sources such as Canadian hospitals and universities.
